At a Glance

Our Value
Providing the highest value analog semiconductor technology and manufacturing solutions, based upon unparalleled trust, strategic customer roadmap and success alignment.

Our Manufacturing Capabilities
Strong global presence in North America, Europe, and Asia, operating multiple world-class manufacturing facilities (150mm, 200mm and 300mm) worldwide, fulfilling growing customer demand and providing capacity assurance, operational flexibility, with geographically spread dual-sourcing capabilities.

Our Technology
We lead the analog ecosystem with high-quality, innovative technological and manufacturing solutions, and provide strong competitive advantages in various growing markets by offering the widest range of customized analog technologies such as Radio Frequency and High-Performance Analog, Power Management, CMOS Image Sensors, Non-Imaging Sensors, and MEMs with cutting edge, innovative market solutions for our diversified and continuously expanding customer base. With ever-evolving capabilities and an innovative mindset, we focus on areas where we can provide strong competitive advantages through win-win differentiated solutions, enabling our customers to lead in their market segments.

Our Finance
Strong financial foundation and business model with focus on margin expansion and free cash flow generation; enabling continuous realization of growth and value-add opportunities.

Our People
Over 5,500 worldwide highly devoted, talented, creative, and skilled employees with broad knowledge, specialized expertise, and profound experience.

Our Vision
Provide the highest value analog semiconductor solutions as validated by our customers, employees, shareholders, and partners.

Our Mission
Being a trusted long-term partner with a positive and sustainable impact on the world through innovative analog technologies and manufacturing solutions.
Our Value Vectors™

**Excellence**
Quality, Efficiency, Effectiveness
*Embedded in everything that we do*

We pursue excellence in everything we do, from ideation to product shipment. Hence, we deliver the best experience to our customers and employees.

**Partnership**
We are a trusted long-term partner for customers, employees and shareholders.

**Impact**
We are committed to making a positive and sustainable impact on the world.

**Leadership**
We lead the analog ecosystem with technology and manufacturing solutions in exciting and growing markets.

**Innovation**
We move great ideas into value in an environment of innovation.
Through our multiple global manufacturing facilities, in Israel, Europe, US and Japan, we provide capacity assurance with high quality and flexible manufacturing capabilities serving fabless companies and IDMs looking to increase production capacity and diversify locations. We operate two manufacturing facilities in Israel (150mm and 200mm), two in the U.S. (200mm), two in Japan (one 200mm and one 300mm). In June 2021, we announced our partnership with ST Microelectronics through which we will be sharing a new 300mm manufacturing facility in Agrate, Italy. In addition, in order to support the increasing demand across all of our business units, numerous end markets and products, we expanded our manufacturing capacity in several of our facilities, and steadily ramped to high utilization, while maintaining superb KPIs.
Committed to excellence in everything we do, we continuously leverage our operational performance into greater levels. With our firm reputation as a leading foundry providing unique, high-end, analog technology manufacturing capabilities, along with our on-going market alignment, we wisely invest in our worldwide manufacturing facilities to best support the ever-evolving needs and growing demand of our customer base.
Technology Leadership

As the world’s leading analog foundry, we deliver the best experience and performance with our broad range of highly advanced analog platforms, innovative technology, and rich manufacturing capabilities, tailored to meet our customers’ precise specifications. Through our well-established, long-term, and trusted partnerships, we remain well versed with the rapidly growing markets and exciting technological trends, continuously pursuing new and innovative horizons.

Dedicated to excellence and driving ideas into value, we serve our customers with our best-in-class, value-add analog solutions for a wide range of markets and end applications, such as communication, consumer, industrial, automotive, medical, aerospace and defense, among others. With our precise and robust technology offerings, we aim to exceed our customers’ needs and expectations, supporting their prominent positions in the relevant market segments.

Our rich and comprehensive technology solutions accompanied by the distinguished flexibility derived from modular and customizable processes in all our platforms, includes Radio Frequency CMOS (RF CMOS) including SiGe, CMOS Image Sensors (CIS), and integration of other types of sensors, advanced analog CMOS, Radio Frequency Identification (RFID), Bipolar CMOS (BiCMOS), Silicon Germanium (SiGe BiCMOS), high-voltage CMOS, Silicon-on-Insulator (SOI) platforms for Power Management, RF and sensor applications, LDMOS transistors, MEMS and wafer bonding technologies, as well as technologies for enabling Artificial Intelligence, in particular original Y-Flash memristors. Complementing our sophisticated technology offerings are the Company’s world-class design enablement services that provide progressive tools supporting quick and accurate design cycles.
Our Business Units

Radio Frequency and High-Performance Analog: Enabling a New Era of Communication
We provide industry-leading, low-loss, high-dynamic range technologies from wireless RF to mmWave communications. Our SiGe BiCMOS, RF-SOI and RF-CMOS technology solutions enable high-speed, low-noise and low-power products for consumer, infrastructure, and automotive applications.

Power Management: The Power to Lead
Our power management platform provides highly modular, industry-leading BCD technologies, with best-in-class power efficiency across a wide range of voltages, delivering comprehensive solutions for the consumer, industrial, infrastructure, automotive, and medical markets.

CMOS Image Sensors: Cutting Edge Imaging Solutions Customized for Your Needs
We offer high-end, state-of-the-art technology solutions, unique customization processes, and unmatched design flexibility, enabling performance-optimized pixel technology with advanced features, and reduced die size, addressing consumer, industrial, medical, high-end photography, automotive, and environmental applications.

Non-Imaging Sensors: Expand the Sensing Capabilities - Lead the World of Sensors
Our proven and flexible capabilities and technological platforms enable fabrication of diverse sensing devices consisting of unique ionizing radiation sensors, remote temperature sensors, magnetic (TMR), UV radiation and gas sensors. In addition, we supply technology for LCOS and uOLED display backplanes, including stitching technology support for large silicon-based displays.

Automotive: Innovative Analog Solutions for Smarter Automobiles
Our broad range of mature and modular analog technology platforms for imaging and sensing, wireless and wireline communications, mixed signal, and power management provide the most comprehensive and advanced solutions designed to best support the entire automotive ecosystem.
Our Analog Business Unit

From RF to power management and mixed-signal CMOS, our Analog Business Unit provides market-leading innovative solutions covering all major segments of the analog semiconductor market.
RF Technology for Mobile Communications
Our technology is leading an active role in enabling the proliferation of 5G systems supporting unprecedented bandwidth in mobile devices through the development and high-volume manufacturing of new, higher speed, lower power RF technologies. The 5G upgrade cycle started in 2020 but has significantly accelerated with the COVID-19 pandemic and is expected to continue through the next several years. Our industry leading RF platform offering includes:

RF SOI
With a strong reputation for best-in-class performance, Tower’s RF SOI technology provides an exceptionally low Ron-Coff figure of merit and high breakdown voltages to enable low insertion loss and high linearity RF switches, antenna tuners, and low-noise-amplifiers to support high data rates and low power consumption, serving the comprehensive needs of 5G enabled handsets.

RF SiGe
With best-in-class noise figure and linearity, SiGe enables not only the highest performance low-noise-amplifiers for applications that include handset receivers, but also higher performance applications such as GPS and satellite receivers. Also, more cost-effective than III-V technologies, SiGe enables a class of low-power power amplifiers for WiFi, Bluetooth and IoT that proliferate new communication devices. And finally, due to its inherent superb high frequency performance, SiGe is used in mmWave applications, such as automotive radar, and can help reduce power consumption in mmWave 5G wireless and other such systems.

High Performance Analog for Optical Infrastructure
We are a recognized leader in SiGe and SiPho technology for optical transceivers. Our SiGe platform is designed to provide the bandwidth and level of quality required for current high volume 100Gb/s systems, as well as the newest standards stretching to 800Gb/s. Our SiPho technology was one of the first and still remains one of the few open foundry SiPho technologies, and as such, has gained wide acceptance. Served markets include data centers as well as telecommunication networks globally.

The following is a brief description of our leading technologies in this area:

High Performance SiGe
Offering superior performance of >300GHz transistor speed supporting next-generation transceivers operating up to 800Gbps. We partner with industry leaders to continuously update our roadmap and provide best-in-class SiGe performance to serve the optical transceiver market.

Silicon Photonics (SiPho)
Now in volume production providing area-optimized solutions with integrated optical detectors, waveguides, and modulators on a single die, enabling significant cost advantages due to high levels of integration and replacing the assembly of discrete components in optical modules. Recently, we announced a new offering with integrated III-V components such as lasers that dramatically simplify our customers’ supply chain and provide them and the optical industry an even stronger value proposition. Tower is the only foundry currently providing such a highly integrated SiPho technology.

Exciting New Markets for SiPho
As our SiPho foundry platform for data-com matures, it is providing a robust and suitable base for adding highly differentiated features that are enabling exciting new and growing markets such as solid-state coherent LiDARs for both automotive and industrial (robots and drones), fiber optic gyroscopes (FOG), high precision medical sensors, photonics-based computing, and AI accelerators. These markets, while nascent today, are expected to show exploding growth over the coming years, and Tower’s SiPho platform is well positioned to capitalize on it.
Power Management

Our power management technology provides best-in-class power efficiency for automotive, consumer, industrial, infrastructure, and medical end-applications through modular, industry-leading BCD platforms across a wide range of voltage requirements.

65nm BCD
Addressing the largest portion of the power IC market, our 65nm BCD is the leading BCD (Bipolar-CMOS-DMOS) technology for low voltage market segments providing the highest power efficiency, best digital integration capability (replacing a ‘multiple chip’ module) and superior cost effectiveness through both low mask count and smallest die size. The platform offers strong competitive advantages for products up to 24V operation such as PMICs, load switches, DC-DC converters, LED drivers, motor drivers, battery management, and analog and digital controllers, among others.

180nm BCD
Offers optimized power performance with best-in-class low Rdson power LDMOS that is scalable from 12V to 180V operation with multiple isolation schemes enabling advanced integration options, with best-in-class form factor, ideally suitable for applications across multiple markets, including automotive (for maximized hybrid/EVs capabilities, as well as motor controllers and drivers, LED headlights and LiDAR); highly efficient data centers (48V DC-DC) and industrial power applications.

Our 200mm Gen6 technology offers over 35% power efficiency improvement and/or equivalent amount of die-area reduction at 24-volt operation through an innovative transistor design. This new technology complements our platform leadership at lower voltages with our previously announced 65-nanometer BCD, 300-millimeter process and at higher voltages, with our recently announced 140-volt RESURF and 200-volt SOI technologies.

Our roadmap includes further broadening of our already served low-voltage market through the addition of new features to our very popular 300mm, 65nm BCD process. Additionally, we continue to expand voltage options and improve power efficiency of our industry-leading 180nm platform serving the automotive, industrial and consumer markets, consistently meeting their developing specifications and requirements.
Our Sensors and Displays Business Unit

Our exclusive and highly prestigious Sensors and Displays business unit serves the highly diversified image sensors, non-imaging sensors, MEMS, micro-LED and micro-OLED display markets. Offering world-leading, state-of-the-art technology, our comprehensive solutions and long-established expertise have gained a worldwide reputation of unparalleled innovative technology making us a leading partner of choice for the manufacturing of the world’s next-generation sensing and silicon-based displays solutions.
Aimed at performance-optimized pixel technology, product excellence, design flexibility and broad support, our distinctive processes, and established CMOS Image Sensor (CIS) technologies lead the way to frontier markets and end-applications. Our vast know-how in building pixels designed to spec along with the specialized in-house technology developments continue to set forth a winning platform of leading features with a profound competitive edge.

Our image sensors division serves a variety of market segments, including our long-term retained markets, such as high-end photography (including cinematography and broadcasting cameras), industrial and machine vision, and medical/dental x-ray large sensors, as well as multiple fast growing markets, such as automotive, optical fingerprint sensors for mobile applications, and Time of Flight (ToF) sensors - both indirect and direct ToF (iToF and dToF) - for mobile face recognition and 3D front looking cameras, as well as AR and gaming applications for the Metaverse era.

We offer world-leading global shutter (GS) pixel technology as well as advanced stacked copper-to-copper bonding back-side illumination (BSI) wafer technology, providing highly advanced features enabling the development of exciting new products for our world’s progressing needs.

Over the past years, we vastly invested in developing specialized technologies, along with building pixels that are designed to spec and silicon proven, enabling profound advantages and opens a path for business growth opportunities.

CMOS Image Sensors
Providing cutting edge imaging and sensing solutions customized for our customers’ needs.
Non-imaging sensors
We offer technological platforms for fabricating diverse sensing devices, consisting of unique ionizing radiation (including x-ray and Radon) sensors, remote temperature sensors, magnetic (TMR), UV radiation and gas sensors. In addition, we supply technology for LCOS and uOLED display backplanes, including stitching technology support for large silicon-based displays for the rising demand in the fast-growing VR market. With its proven capabilities and high flexibility, this diverse offering enables the manufacturing and embedding of sophisticated sensors which are in high demand in today’s ‘connected’ world.

Remote temperature sensors: provide high sensitivity and accuracy in a broad temperature range, serving the mobile, IoT, industrial, automotive, medical and security markets;

Time-temperature indicator sensors: CMOS embedded and reusable sensors with no need for power supply, serving the food industry, agriculture, medical and pharmaceutical markets;

Floating gate radiation sensors: reusable sensors with no power supply required and no scintillator, serving radiation monitors, radiation badges, sterilization and Radon detectors;

Magnetic sensors: high sensitivity Tunnel Magnetoresistance (TMR) sensors for magnetic field strength sensing, serving the industrial, automotive, and consumer markets, as well as the space industry;

UV sensing: solar blind, with record sensitivity and operation at high temperatures, serving applications such as skin protection, flame diagnostics, free space optical communication, sterilization, and industrial automation;

Gas and humidity sensors: operation at high temperatures, easy and fast reset, and sensor fusion for multiple gases, serving automotive, industrial, medical, and environmental applications.

All sensor technologies described above are based on unique platforms developed in-house such as embedded non-volatile floating gate solutions, GaN-based devices, and MEMS-based membranes, alongside our internal design capabilities that provide embedded electronics to perform full sensor on chip.

MEMS
Focusing on MEMS devices that can be fabricated and scalable to mass volume in a CMOS foundry, we have developed a unique cost-effective platform for MEMS microphones, as well as a one for high end accelerometers. We continue to enrich our platform offering by adding more capabilities to serve additional growing MEMS markets.

Displays
We are engaged in co-development projects with leading partners of next-generation micro-LED and micro-OLED silicon-based displays ranging from very large TV screens, through laptop and tablet screens to VR goggles’ very high-resolution screens for the Metaverse era. This market, even though at its development stage, is expected to grow to substantial volumes from 2023 onwards, where we are already well positioned with a strategic signature market share and an established technology.
Automotive

Through our mature and modular platforms, we offer comprehensive and advanced analog technology solutions designed to best support the entire automotive ecosystem.

Our technology offerings and long-term roadmap strategy are aligned with the three mega trends that are driving rapid growth in the automotive market: ubiquitous connectivity, ever-increasing vehicle autonomy and total powertrain electrification. By partnering with the market segment leaders, we develop best-in-class technologies, supporting the widest range of automotive market customers from OEMs and Tier-1 integrators to IDMs and fabless.

Our advanced power management platforms offer the lowest Rdson with superior voltage and current handling capability for a wide range of applications, such as motor drivers, DC-DC converters, battery management ICs, PMICs, load switches, voltage regulators, LED drivers and more.

Our CMOS image sensor technology offers superior SPADs for LiDAR. Utilizing our highly advanced global shutter (GS) technology, enables attaining unparalleled imaging capabilities in applications that require Time-of-Flight (ToF) sensing, minimal LED flicker sensitivity, ultra-low-light sensitivity, as well as thermal imaging. The GS technology is a go-to choice for the most advanced textured light applications, such as gesture control and passenger monitoring. In addition, our non-imaging sensor platforms provide diverse targeted sensor platforms for ambient, health and proximity monitoring.

Our High-performance SiGe technology is already deployed in high volume radar and is ready to enable V2X and 5G communications. Our Silicon Photonics technology is enabling innovative compact LiDARs for fully autonomous vehicles and robots. With our best-in-class RFSOI and RFCMOS technologies, Tower is a supplier of choice to market leaders in every high-performance RF and analog market segment.

With our leading-edge analog technologies, best-in-class design enablement, flexible foundry engagement models (including custom design services through our worldwide design center and process transfer & optimization services) and strong culture of excellence in all of our IATF16949 certified manufacturing facilities, we continue to expand and gain market share in different market segments by delivering innovative current and next-generation technological solutions for the rapidly evolving automotive world.
Through our Newport Beach facility, we are partnering with a variety of companies in the Aerospace and Defense arena, holding a firm market position that continues to grow year over year. By leveraging the wide range of the Company’s high-volume commercial technology portfolio, we provide the vast A&D community with advanced and sophisticated solutions, including Silicon Photonics for Optical communication, large format ROICs (readout integrated circuits) in support of numerous IR applications and systems, visible imaging, and SiGe for radar, radio, and high-speed data communications.

As an ITAR certified facility with trusted foundry access, we also support various critical US government projects and needs. We are the number one foundry of choice for ROICs and hold a leading position in SiGe and Silicon Photonics (SiPho) in the DoD fabrication space.

Aimed to best serve our customer’s needs and development processes, our platform-rich features include:
- Industry leading Silicon Photonics technologies enabling exciting new advancements in the Optical Communications arena.
- 180nm, 130nm and 65nm ROIC & CIS with stitching supporting ITAR protocol.
- Technical teams and program management specifically dedicated to the A&D customer base.
- World class design enablement environment leveraging Tower Semiconductor’s commercial offerings to enable an efficient and accurate design process and first-time silicon success.

Enhancing our leading foundry position and ensuring our continuous support of the A&D community, we are engaged in various strategic and specialized activities addressing market-specific applications such as: satellite, radar, high speed data transmissions, multiple infrared and visible imager applications, various sensors, complex ADC/DACs, as well as optical data applications meeting the requirements of the broad Military/Governmental customer base.
We offer the most accurate electronic design automation (EDA) tools and design intellectual property (IP), as well as customized design services and support through our worldwide design center.

We focus on enabling an effective and successful design cycle as well as first time working silicon so that our customers meet the advanced requirements for smart IC’s in diverse markets, such as connectivity, consumer, industrial, and automotive. Through long-term collaboration with the world’s major EDA, IP and design partners, we offer differentiated and application relevant design capabilities that enable fabless design teams to maximize their products’ performance products while shortening the time to market.

We continue to expand our design services, tools, and support to answer the evolving market needs and provide our customers with the most advanced solutions and services, enabling successful design of next-generation ICs and driving innovation and high performance in the broadest market spread.

**Worldwide Design Enablement**

Our distinctive design enablement platform provides a robust design ecosystem, which together with our advanced analog technologies, promotes the highest level of collaboration driving our customers’ innovative ideas into value.
Where Analog and Value Meet
Research and Development
Promoting a global environment of innovation and progress, Tower Semiconductor is continuously developing advanced production platforms comprising breakthrough solutions for diverse existing and emerging analog electronics markets, such as consumer electronics, industrial, wireless communications, optical communications, automotive, medical, and aerospace and defense.

The Company’s recent research activities address the emerging fields of advanced driver assistance systems for automotive (ADAS), high-frequency devices to enable various communications and mobile applications, RF switches, smart power management, novel silicon photonics systems, smart CMOS image sensors, non-imaging sensors, quantum computing, and artificial intelligence for data processing. These devices and technologies being developed are targeting our initiatives in emerging markets such as 5G and 6G, data center network traffic at 100G, 400G, 800G and beyond, smart power and battery control, industrial and commercial sensors, and aerospace & defense.

**New technological platforms, achievements, and novel devices**

Tower Semiconductor is continuously engaged in numerous R&D activities based on original patented ideas of its engineers, close collaboration with its customers, and partnerships with leading research centers worldwide. These activities target new production platforms and specialized solutions for its customers to meet the emerging demands and product roadmaps of the industry.

**Ongoing Innovation Partnerships**

Tower takes an ongoing part in numerous prestigious consortiums and collaborations with world-leading academic institutions in the US, Europe, and Israel.

**Patents**

Every year, the Company files and is granted a respectable number of patents. These patents span the breadth of Tower technology across all its business units and opens the path to frontier technological achievements.

**Talks and Publications**

Tower Semiconductor engineering experts serve as members of technical/scientific committees and reviewers of leading international journals and scientific conferences, such as IEEE IMW, Electronics, IEEE ED. In addition, every year numerous scientific papers by Company engineers are published in various journals as well as invited talks presented in leading technological forums, panels, and conferences worldwide.
